LABORATORY REPORT

PATIENT NAME	: Mrs. BABITA CHOWDHURY	UHID	: ILBS.0000428186
AGE/SEX	: 52Y 7M /FEMALE	REFERRING DOCTOR	: Dr. S.K SARIN
SAMPLE NO	: 266446135		
SAMPLE COLLECTION DATE	: 08/08/2026 10:27	SAMPLE ACCESSIONING DATE	: 08/08/2026 10:57
Bill NO	: ILBS/OP/26/279489	REPORT VERIFIED DATE	: 08/08/2026 15:11
FINALISED BY	: Dr. NILAKSHI GUPTA		
CASE NO	: OP/ILBS/26/184937		
ORDER DATE	: 08/08/2026 10:13	PRINT DATE	: 08/08/2026 15:56

VIROLOGY

Parameter	Result	Methodology
Anti HB core (total)**		
SAMPLE TYPE	Serum	
RESULT.	Non Reactive	CLIA
SAMPLE/CUTOFF RATIO (S/CO)	0.11	

Interpretation

Interpretation according to Signal sample/cut-off index (S/Co):

>=1.0 - Reactive

>= 0.9 to <1 - Indeterminate

<0.9 - Non-reactive

A **reactive** result indicates presence of antibodies (either IgM, or IgG or both) to Hepatitis B virus (HBV) core antigen (HBcAg) and indicate either current or past infection with the virus.

An **indeterminate** result signifies values in the grey zone between clear positive and clear negative. It is advised to repeat the assay after 2-3 weeks.

A **non-reactive** result indicates absence of antibodies (either IgM, or IgG or both) to Hepatitis B virus (HBV) core antigen.

Uses of the assay: To screen

1. For current or past infection with HBV.
2. Blood units for evidence of HBV infection.

Causes of false-positive results:

1. Autoimmune hepatitis, other autoimmune diseases
2. Non-specific reactions associated with competitive anti-HBcore ELISA's
3. Cross reactivity with IgA or IgM related molecules produced from non-specific HBV activated B lymphocytes.

Causes of false-negative results:

1. Early acute Hepatitis B
2. Low antibody levels below the detection limit of the assay
3. Immunosuppressive states

HBV core antigen (HBcAg) is a non-glycosylated protein which forms the nucleocapsid of the virus. IgM antibodies to HBcAg become

VIROLOGY

Parameter	Result	Methodology
detectable in serum shortly before the onset of symptoms of acute hepatitis by HBV. Over months, these are replaced by IgG type antibodies, the latter signifying past infection with HBV.		

The above is a chemiluminescence immunoassay (CLIA) assay for the detection of anti-HBc (total) antibodies in the serum.

Note: The results of serological assays in themselves should not be the only reason for any therapeutic consequences. They should always be assessed in conjunction with the patient's history, clinical observations and other diagnostic tests.

FINALISED BY	: Dr. Sherin Thomas		
CASE NO	: OP/ILBS/26/184937		
ORDER DATE	: 08/08/2026 10:13	PRINT DATE	: 08/08/2026 17:17

BIOCHEMISTRY

Parameter	Result	Units	Reference Range
ENHANCED LIVER FIBROSIS (ELF) TEST			
ELF SCORE	10.51		<7.7
HYALURONIC ACID (HA)	128	ng/ml	<54.39
NTERMINAL PROPEPTIDE OF TYPE III PROCOLLAGEN (PII)	11.43	ng/ml	<7.85
TISSUE INHIBITOR OF MATRIX METALLOPROTEINASE 1 (TI)	319.8	ng/ml	<138.18

Interpretation :

Enhanced Liver Fibrosis (ELF) Test is a multivariate index assay intended to provide a single ELF score by combining in an algorithm the quantitative measurements of hyaluronic acid (HA), amino-terminal propeptide of type III procollagen (PIIINP) and tissue inhibitor of matrix metalloproteinase 1 (TIMP-1). HA is a glycosaminoglycan that is produced by hepatic stellate cells, PIIINP is a marker of early fibrogenesis and inflammation and TIMP-1 is the circulating inhibitor of matrix metalloproteinase (MMP) enzymes that can enhance fibrogenesis. Together these assays measure qualitative and quantitative changes in the extracellular matrix (ECM).

The ELF score may be useful as a baseline determination of liver fibrosis for monitoring changes in fibrosis over time (natural history); before, during and after therapy or lifestyle modification; and as an aid in determining prognosis.

Interpretation of Result:-

ELF Score	Severity of Liver Fibrosis
<7.7	None to mild
> 7.7 - <9.8	Moderate
>9.8	Severe

Results of this assay should always be interpreted in conjunction with the patients medical history clinical presentation, and other findings.
