Creatinine

1	Creatinine	0.79	mg/dL	0.5 - 1.3
	Serum, Method: Alkaline picrate kinetic			

Interpretation

Creatinine is a waste product produced by muscles from the breakdown of a compound called creatine. Creatinine is removed from the body by the kidneys, which filter almost all of it from the blood and release it into the urine. Increased creatinine levels in the blood suggest kidney disease or other conditions that affect kidney function. Low blood levels of creatinine are not common, but they are also not usually a cause for concern. They can be seen with conditions that result in decreased muscle mass.

---	---	------	-------	---

Interpretation

Glucose is the primary energy source for the body's cells and the only energy source for the brain and nervous system. High levels of glucose most frequently indicate diabetes, but many other diseases and conditions can also cause elevated blood glucose. Hypoglycemia is characterized by a drop in blood glucose to a level where first it causes nervous system symptoms (sweating, palpitations, hunger, trembling, and anxiety), then begins to affect the brain (causing confusion, hallucinations, blurred vision, and sometimes even coma and death).

Lipid Profile

1	Total Cholesterol Serum, Method: Cholesterol oxidase,esterase,peroxidase	131.0	mg/dL	Desirable: <200; Borderline high = 200-239; High: > 240
2	Triglycerides Serum, Method: Enzymatic, end point GPO-POD	108.0	mg/dL	Desirable: <150 Borderline High: 150 - 199 High: > 200 - 499
3	HDL-Cholesterol Serum, Method: Enzymatic Immunoinhibition	45.0	mg/dL	30 - 60
4	LDL-Cholesterol Serum, Method: Calculated	64.0	mg/dL	Optimal: <100; Near Optimal: 100-129; Borderline High: 130-159; High: 160-189; Very high: >190
5	Cholesterol/HDL ratio Serum, Method: Calculated	2.91		Optimal: <3.5 Near Optimal: 3.5 - 5.0 High >5.0
6	VLDL Cholesterol Serum, Method: Calculated	21.6	mg/dL	6 - 40
7	Non HDL Cholesterol Serum, Method: Calculated	86.00	mg/dl	Desirable: <130 Borderline high: 130-159 High : 160-189 Very High >190
8	LDL /HDL ratio Serum, Method: Calculated	1.42		Optimal: <2.5 Near Optimal: 2.5-3.5 High >3.5

Interpretation

1. When serum Triglyceride concentration exceeds 500 mg/dl (4.52 mmol/L) or when chylomicrons are present (Post fed stage), Friedel Equation for estimation of VLDL -C = TG/5 (Friedal et al 1972) is not used. VLDL -C are not calculated. When triglycerides are very high greater than 1000mg/dl, there is a risk of developing pancreatitis in children and adults. Triglycerides change dramatically in response to meals, increasing as much as 5 to 10 times higher than fasting levels just a few hours after eating. Therefore modest changes in fasting triglycerides measured on different days are not considered to be abnormal."

2. HDL -Cholesterol : HDL-C is also called Good cholesterol because it removes excess cholesterol from tissues and carries it to the liver for disposal. If HDL-C is less than 40mg/dl for men and less than 50mg/dl for women, there is increased risk of heart disease that is independent of other risk factors including the LDL-C level. NCEP guidelines suggest that an HDL cholesterol value greater than 60 mg/dl is protective.

3. LDL Cholesterol : Desired goal for LDL-C levels change based on individual risk factors, For young adults less than 120 mg/dl is acceptable. Values between 120 to 159 mg/dl are considered as borderline high. Values greater than 160 mg/dl are considered high. Low levels of LDL cholesterol may be seen in people with an inherited lipoprotein deficiency and in people with hyperthyroidism, infection, inflammation or cirrhosis.
