Human Papilloma Virus, Real Time PCR

Tests:	Observation	Range	Unit
MOLECULAR BIOLOGY (HPV 16, 31, 18 & 45) RESULT:			
HPV : 16/18	Not Detected		
HPV : 31/33/35/45/52/58	Not Detected		
Method: Real Time PCR.			
Control Ct	29.0		
Test Ct HPV 16/18	ND		
Test Ct HPV 31/33/35/45/52/58	ND		
Comment:	REPORTED BY : Dr. CHITERLEKHA KUNDAL M.B.B.S, MD(PATHOLOGY)		

Test Description:

MOLECULAR BIOLOGY (HPV 16, 31, 18 & 45) RESULT:

INTERPRETATION:

HPV 16/18	HPV IPC Result interpretation 31/33/35/45/52/58	IPC	Result interpretation
+	+	+/-	HPV 16/18 POSITIVE HPV 31/33/35/45/52/58 POSITIVE
+	-	+/-	HPV 16/18 POSITIVE HPV31/33/35/45/52/58 NEGATIVE
-	+	+/-	HPV 16/18 NEGATIVE HPV 31/33/35/45/52/58 POSITIVE
-	-	+	HPV 16/18 NEGATIVE HPV 31/33/35/45/52/58 NEGATIVE

Result	Ct Value
HIGH	Ct <20
MEDIUM	20<=Ct <25
LOW	25<=Ct <30

UID#:	69163	Report Status:	Final
VERY LOW Ct = 30			

Note:

HPV-HR chip based Real Time Duplex PCR test for High Risk Types 16, 31 & 18, 45 is a Semi Quantitative test. Based on the target ct

value the results will be displayed as "HIGH", "MEDIUM" or "LOW".

Target Gene: The target sequence for this assay are the regions within the E6 & E7 genes of high risk HPV types 16, 18, 31 & 45.

Technology:

In this assay test the presence of HPV-HR is determined by chip based real time duplex PCR. It involves the specific amplification of HPV target region of the HPV genome. This analysis is done on True lab real time PCR by using the higher sensitive and specific TAQMAN assay method. Amplified products are indicated by threshold cycle (Ct) in amplification curve.

Pathogen Information:

Human papillomavirus (HPV) is a non-enveloped, double stranded DNA virus from the papilloma family. It infects squamous epithelia including the skin & mucosa of the upper respiratory & anogenital tracts. HPV viruses are classified as either 'high risk' or 'low risk' types depending on their association with the development of cancer. Persistent infection by high risk HPV types, such as HPVs 16, 18, 31 & 45 is associated with the occurrence of malignant and pre-malignant lesions that are detectable in more than 90% of cervical cancers.

Note: Assay result should be interpreted only in the context of other laboratory findings and the total clinical status of patient.

Pap Smear - Liquid Based (LBC)

Tests:	Observation	Range	Unit
Cytology Number	C-584/26		
Specimen Details	CERVICAL BRUSHING RECEIVED IN THIN PREP PRESERVATIVE SOLUTION. ONE PAPANICULAOU SMEAR PREPD.		
Microscopic Examination	2014 BETHESDA SYSTEM.		
Adequacy	SMEAR IS SATISFACTORY FOR EVALUATION.		
Squamous Cells	ADEQUATE		
Maturation	ADEQUATE		
Atrophy	NIL		
Reactive Changes	NIL		
Endocervical Cells	PRESENT		
Inflammation	POLYMORPHS		
Bacterial Flora	BACTERIAL VAGINOSIS		
Fungus	NIL		
Trichomonas	NIL		
Dysplastic Changes	NIL		
Interpretation:	1.NEGATIVE FOR INTRA EPITHELIAL LESION OR MALIGNANCY 2. INFLAMMATORY SMEAR BECAUSE OF BACTERIAL VAGINOSIS		
Comment:	(PAP STAIN: PAPANICALOU STAIN). REPORTED BY : DR. ARVIND RAJWANSHI(M.B.B.S, MD)(CONSULTANT PATHOLOGIST)		

Test Description:

Pap Smear - Liquid Based (LBC) BD SurePath

- Assessment of dysplasia is based on the Bethesda system 2014
 - ASCUS: Atypical Squamous cells of undetermined significance.
 - LGSIL : Low Grade Squamous Intra-Epithelial Lesion.
 - CIN I / Mild dysplasia.
 - HSIL : High Grade Squamous Intraepithelial Lesion.

Bhor Diagnostic Centre

UID#:	69163	Report Status:	Final

■ CIN II / Moderate Dysplasia

■ CIN III / Severe Dysplasia/Ca-in-situ

○ AGUS : Atypical Glandular Cells of undetermined significance.

○ Reactive Changes : Cytolysis/Cell-Nuclear Debris/Benign changes.

- The PAP smear is for screening only , it is not diagnostic. It identifies patients at risk for dysplasia/cancer.
- Presence of endocervical cells indicates the adequacy of the PAP smear but in practice detected uncommonly.
- PAP smear can not be trusted to diagnose inflammation/infection.
- Squamous cells maturation is a poor indicator of the hormonal status of the menstrual cycle especially in inflammation.
- The clinical state of menopause does not always correlate with atrophic cells in smear.
- Presence of Candida does not necessarily implicate the fungus in inflammation.
- Abnormal smears should be confirmed for HPV infection by molecular studies(PCR).
- Repeat smears are advised after treatment of inflammation, if any.

Note : Reliability of cytology ; About 80%.
